

CAX803, CAX809, CAX810

3-Pin Microprocessor Power Supply Supervisors

Description

The CAX803, CAX809, and CAX810 are supervisory circuits that monitor power supplies in digital systems. The CAX803, CAX809, and CAX810 are direct replacements for the MAX803, MAX809 and MAX810 in applications operating over the industrial temperature range.

These devices generate a reset signal, which is asserted while the power supply voltage is below a preset threshold level and for at least 140 ms after the power supply level has risen above that level. The underlying floating gate technology, Analog EEPROM used by ON Semiconductor, makes it possible to offer any custom reset threshold value. Seven industry standard threshold levels are offered to support +5.0 V, +3.3 V, +3.0 V and +2.5 V systems.

The CAX803 has an open-drain $\overline{\text{RESET}}$ output (active LOW). The CAX803 requires a pull-up resistor on the reset output.

The CAX809 features a push-pull $\overline{\text{RESET}}$ output (active LOW) and the CAX810 features a push-pull RESET output (active HIGH).

Fast transients on the power supply are ignored and the output is guaranteed to be in the correct state at V_{CC} levels as low as 1.0 V.

The CAX803, CAX809, and CAX810 are available in the compact 3-pin SOT-23 package.

Features

- Precision Monitoring of
 - +5.0 V (-5%, -10%, -20%),
 - +3.3 V (-5%, -10%),
 - +3.0 V (-10%) and
 - +2.5 V (-5%) Power Supplies
- Offered in Three Output Configurations:
 - CAX803: Open-Drain Active LOW Reset
 - CAX809: Push-Pull Active LOW Reset
 - CAX810: Push-Pull Active HIGH Reset
- Direct Replacements for the MAX803, MAX809 and MAX810 in Applications Operating over the Industrial Temperature Range
- Reset Valid down to $V_{CC} = 1.0$ V
- 10 μA Power Supply Current
- Power Supply Transient Immunity
- Industrial Temperature Range: -40°C to $+85^{\circ}\text{C}$
- Available in SOT-23 Package
- These Devices are Pb-Free and are RoHS Compliant

Applications

- Computers, Servers, Laptops, Cable Modems
- Wireless Communications
- Embedded Control Systems
- White Goods, Power Meters
- Intelligent Instruments
- PDAs and Handheld Equipment

ORDERING INFORMATION

See detailed ordering and shipping information in the package dimensions section on page 9 of this data sheet.

CAX803, CAX809, CAX810

Table 1. THRESHOLD SUFFIX SELECTOR

Nominal Threshold Voltage	Threshold Suffix Designation
4.63 V	L
4.55 V	H
4.38 V	M
4.00 V	J
3.08 V	T
2.93 V	S
2.63 V	R
2.32 V	Z

Table 2. PIN DESCRIPTIONS

Pin Number			Name	Description
CAX803	CAX809	CAX810		
1	1	1	GND	Ground
2	2	–	RESET	Active LOW reset. RESET is asserted if V_{CC} falls below the reset threshold and remains low for at least 140 ms after V_{CC} rises above the reset threshold.
–	–	2	RESET	Active HIGH reset. RESET is asserted if V_{CC} falls below the reset threshold and remains high for at least 140 ms after V_{CC} rises above the reset threshold.
3	3	3	V_{CC}	Power supply voltage that is monitored.

Table 3. ABSOLUTE MAXIMUM RATINGS

Parameter	Rating	Units
Any pin with respect to ground	–0.3 to +6.0	V
Input Current, V_{CC}	20	mA
Output Current, RESET, RESET	20	mA
Rate of Rise, V_{CC}	100	V/ μ s
Continuous Power Dissipation Derate 4 mW/ $^{\circ}$ C above 70 $^{\circ}$ C (SOT23)	320	mW
Operating Temperature Range	–40 to +85	$^{\circ}$ C
Storage Temperature Range	–65 to +105	$^{\circ}$ C
Lead Soldering Temperature (10 sec)	300	$^{\circ}$ C

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

Detailed Descriptions

Reset Timing

The reset signal is asserted LOW for the CAX803/CAX809 and HIGH for the CAX810 when the power supply voltage falls below the threshold trip voltage and remains asserted for at least 140 ms after the power supply voltage has risen above the threshold.

Figure 6. Reset Timing Diagram

VCC Transient Response

The CAX803/CAX809/CAX810 protect μ Ps against brownout failure. Short duration transients of 4 μ sec or less and 100 mV amplitude typically do not cause a false RESET.

Figure 7 shows the maximum pulse duration of negative-going V_{CC} transients that do not cause a reset condition.

As the amplitude of the transient goes further below the threshold (increasing $V_{TH} - V_{CC}$), the maximum pulse duration decreases. In this test, the V_{CC} starts from an initial voltage of 0.5 V above the threshold and drops below it by the amplitude of the overdrive voltage ($V_{TH} - V_{CC}$).

Figure 7. Maximum Transient Duration without Causing a Reset Pulse vs. Reset Comparator Overdrive

CAX803, CAX809, CAX810

Valid RESET with V_{CC} Under 1.0 V

To ensure that the CAX809 RESET pin is in a known state when V_{CC} is under 1.0 V, a $>10\text{ k}\Omega$ pull-down resistor between RESET pin and GND is recommended. For the CAX810, a pull-up resistor from RESET pin to V_{CC} is needed.

Figure 8. RESET Valid with V_{CC} Under 1.0 V

Figure 9. RESET Valid with V_{CC} Under 1.1 V

Bi-directional Reset Pin Interfacing

The CAX809/810 can interface with $\mu\text{P}/\mu\text{C}$ bi-directional reset pins by connecting a $4.7\text{ k}\Omega$ resistor in series with the CAX809/810 reset output and the $\mu\text{P}/\mu\text{C}$ bi-directional reset pin.

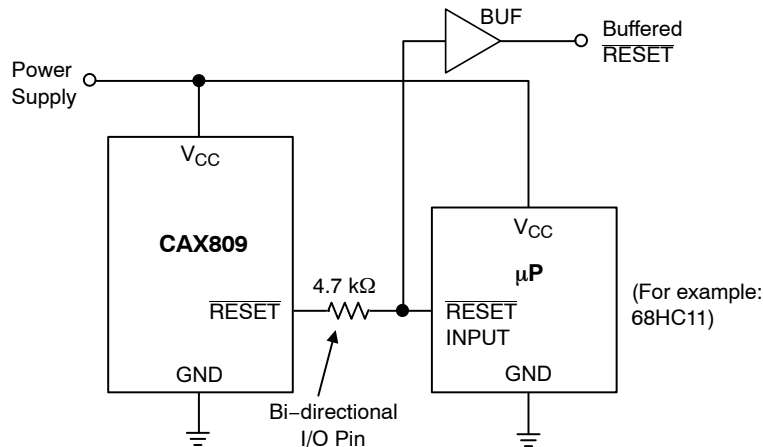

Figure 10. Bi-directional Reset Pin Interfacing

CAX803 Open-Drain RESET Application

The CAX803 features an open-drain RESET output and therefore needs a pull-up resistor on the output for proper operation, as shown on Figure 11. An advantage of the open-drain output includes the ability to “wire AND” several outputs together to form an inexpensive logic circuit. It is also possible to have the pull-up resistor connected to a different supply which can be higher than the CAX803 V_{CC} pin. The value of the pull-up resistor is not critical in most applications, typical values being between $5\text{ k}\Omega$ and $10\text{ k}\Omega$.
