■ PIN CONFIGURATION

■ PIN DESCRIPTION

PIN NAME	DESCRIPTION
V _{IN}	Power Input Voltage. Supply voltage can range from 2.3V to 6V. Bypass with a 1μF capacitor to GND.
GND	Ground
EN	Active-Low Shutdown Input. A logic low at EN reduces supply current to 0.01μA. Connect EN to V _{IN} for normal operation.
V _{OUT}	Output Voltage
ADJ	Voltage-adjust Input. Connect an external resistive voltage-divider from V _{OUT} to ADJ to set the output voltage between 0.8V and 5V.

- The minimum operating value for V_{IN} is equal to either [V_{OUT(NOM)} + V_D] or 2.3V, whichever is greater
- Dropout voltage is defined as the voltage from the input to output when output is 2% below the nominal value.
- Output voltage line regulation is defined as the change in output voltage from the nominal value resulting from a change in the input line voltage. Output voltage load regulation is defined as the change in output voltage from the nominal value as the load current increases from no load to full load.
- Regulation is measured at constant junction temperature by using a 20ms current pulse. Devices are tested for load regulation in the load range from 10mA to 600mA.
