

## UB261

Preliminary

CMOS IC

### 1-CELL LITHIUM-ION/POLYMER BATTERY PROTECTION IC

#### DESCRIPTION

The UTC **UB261** is a series of lithium-ion/lithium-polymer rechargeable battery protection ICs incorporating high accuracy voltage detection circuits and delay circuits.

The UTC **UB261** is suitable for protection of single cell lithium-ion / lithium polymer battery packs from overcharge, over discharge and over current.

The ultra-small package and less required external components make it ideal to integrate the UTC **UB261** into the limited space of battery pack.

SOT-26

#### FEATURES

- \* Wide Supply Voltage Range:  $V_{DD}=1.5V\sim 8.0V$
- \* Ultra-Low Quiescent Current:  $I_{OPE}=3.0\mu A$  ( $V_{DD}=3.5V$ )
- \* Ultra-Low Power-Down Current:  $I_{PDN}=0.2\mu A$  ( $V_{DD}=1.5V$ )
- \* Overcharge Detection Voltage:  $V_{CU}=3.9V\sim 4.4V$
- \* Overcharge Release Voltage:  $V_{CL}=3.8V\sim 4.4V$
- \* Over Discharge Release Voltage:  $V_{DL}=2.0V\sim 3.0V$
- \* Over Discharge Release Voltage:  $V_{DU}=2.0V\sim 3.4V$
- \* Over Current 1 Detection Voltage:  $V_{IOV1}=0.05V\sim 0.30V$
- \* Over Current 2 Detection Voltage:  $V_{IOV2}=0.5V$  (Fixed)
- \* Short Circuit Detection Voltage:  $V_{SHORT}=1.2V$  (Fixed)
- \* Charger Detection Voltage:  $V_{CHA}=-0.7V$  (Fixed)
- \* Delay Times are Generated by an Internal Circuit. (External Capacitors are Unnecessary.)

#### ORDERING INFORMATION

Ordering Number		Package	Packing
Lead Free	Halogen Free		
UB261L-xx-AG6-R	UB261G-xx-AG6-R	SOT-26	Tape Reel

Note: xx: Output Voltage, refer to Marking Information.

<p>UB261L-xx-AG6-R</p>	<p>(1) R: Tape Reel  (2) AG6: SOT-26  (3) xx: Refer to Marking Information  (4) L: Lead Free, G: Halogen Free</p>

### PIN CONFIGURATION

### PIN DESCRIPTION

PIN NO.	PIN NAME	DESCRIPTION
1	DO	For discharge control: FET gate connection pin
2	V <sub>M</sub>	For current sense and charger detection input pin
3	CO	For charge control: FET gate connection pin
4	DP	Test pin for delay time measurement
5	V <sub>DD</sub>	Positive power input
6	V <sub>SS</sub>	Negative power input

■ BLOCK DIAGRAM

■ ABSOLUTE MAXIMUM RATING ( $V_{SS}=0V$ ,  $T_A=25^\circ C$  unless otherwise specified)

PARAMETER	SYMBOL	RATINGS	UNIT
Input Voltage Between $V_{DD}$ and $V_{SS}$ (Note 2)	$V_{DD}$	$V_{SS}-0.3 \sim V_{SS}+12$	V
CO Output Pin Voltage	$V_{CO}$	$V_{DD}-12 \sim V_{DD}+0.3$	V
DO Output Pin Voltage	$V_{DO}$	$V_{SS}-0.3 \sim V_{DD}+0.3$	V
$V_M$ Input Pin Voltage	$V_M$	$V_{DD}-14 \sim V_{DD}+0.3$	V
Ambient Operating Temperature	$T_{OPR}$	-40 ~ +85	$^\circ C$
Storage Temperature	$T_{STG}$	-55 ~ +125	$^\circ C$

- Notes: 1. Absolute maximum ratings are those values beyond which the device could be permanently damaged. Absolute maximum ratings are stress ratings only and functional device operation is not implied.  
 2. Pulse ( $\mu sec$ ) noise exceeding the above input voltage ( $V_{SS}+12V$ ) may cause damage to the IC.

■ ELECTRICAL CHARACTERISTICS ( $V_{SS}=0V$ ,  $T_A=25^\circ C$  unless otherwise specified)

PARAMETER	SYMBOL	TEST CONDITIONS	MIN	TYP	MAX	UNIT
<b>CURRENT CONSUMPTION</b>						
Supply Current	$I_{OPE}$	$V_{DD}=3.5V$ , $V_M=0V$		3.0	8.0	$\mu A$
Power-Down Current	$I_{PDN}$	$V_{DD}=V_M=1.5V$		0.2	0.5	$\mu A$
<b>OPERATING VOLTAGE</b>						
Operating Voltage Between $V_{DD}$ -pin and $V_{SS}$ -pin	$V_{DS1}$		1.5		8	V
Operating Voltage Between $V_{DD}$ -pin and $V_M$ -pin	$V_{DS2}$		1.5		10	V
<b>DETECTION VOLTAGE</b>						
Overcharge Detection Voltage	$V_{CU}$		$V_{CU}-0.050$	$V_{CU}$	$V_{CU}+0.050$	V
Overcharge Release Voltage	$V_{CL}$		$V_{CL}-0.050$	$V_{CL}$	$V_{CL}+0.050$	V
Overdischarge Detection Voltage	$V_{DL}$		$V_{DL}-0.100$	$V_{DL}$	$V_{DL}+0.100$	V
Overdischarge Release Voltage	$V_{DU}$		$V_{DU}-0.100$	$V_{DU}$	$V_{DU}+0.100$	V
Over Current 1 Detection Voltage	$V_{IOV1}$	$V_{DD}=3.5V$	$V_{IOV1}-0.03$	$V_{IOV1}$	$V_{IOV1}+0.03$	V
Over Current 2 Detection Voltage	$V_{IOV2}$	$V_{DD}=3.5V$	0.35	0.50	0.65	V
Load Short Circuit Detection Voltage	$V_{SHORT}$		0.5	1.2	1.7	V
Charger Detection Voltage	$V_{CHA}$	$V_{DU} \neq V_{DL}$	-1.6	-0.7	-0.2	V
<b>0V BATTERY CHARGE VOLTAGE</b>						
0V Battery Charge Inhibition Battery Voltage	$V_{0INH}$			0.9	1.8	V
<b>INTERNAL RESISTANCE</b>						
Resistance between VM-pin and $V_{DD}$ -pin	$R_{VMD}$	$V_{DD}=1.8V$ , $V_M=0V$	100	300	900	k $\Omega$
Resistance between VM-pin and $V_{SS}$ -pin	$R_{VMS}$	$V_{DD}=3.5V$ , $V_M=1.0V$	10	30	70	k $\Omega$
<b>OUTPUT RESISTANCE</b>						
CO-pin Resistance "H"	$R_{COH}$	$V_{CO}=3.0V$ , $V_{DD}=3.5V$ , $V_M=0V$		5	10	k $\Omega$
CO-pin Resistance "L"	$R_{COL}$	$V_{CO}=0.5V$ , $V_{DD}=4.5V$ , $V_M=0V$		5	10	k $\Omega$
DO-pin Resistance "H"	$R_{DOH}$	$V_{DO}=3.0V$ , $V_{DD}=3.5V$ , $V_M=0V$		5	10	k $\Omega$
DO-pin Resistance "L"	$R_{DOL}$	$V_{DO}=0.5V$ , $V_{DD}=V_M=1.8V$		5	10	k $\Omega$
<b>DELAY TIME</b>						
Overcharge Detection Delay Time	$t_{CU}$		0.9	1.2	1.5	s
Overdischarge Detection Delay Time	$t_{DL}$		110	150	190	ms
Over Current 1 Detection Delay Time	$t_{IOV1}$	$V_{DD}=3.5V$	6	9	12	ms
Over Current 2 Detection Delay Time	$t_{IOV2}$	$V_{DD}=3.5V$	1	2.2	3.2	ms
Short Circuit Detection Delay Time	$t_{SHORT}$		120	300	380	$\mu s$

## ■ OPERATION

### 1. Normal Condition

The **UTC UB261** series monitors the voltage of the battery connected between  $V_{DD}$  pin and  $V_{SS}$  pin and the voltage difference between  $V_M$  pin and  $V_{SS}$  pin to control charging and discharging. When the battery voltage is in the range from the overdischarge detection voltage ( $V_{DL}$ ) to the overcharge detection voltage ( $V_{CU}$ ), and the  $V_M$  pin voltage is in the range from the charger detection voltage ( $V_{CHA}$ ) to the overcurrent 1 detection voltage ( $V_{IOV1}$ ), the IC turns both the charging and discharging control FETs on. This condition is called the normal condition, and in this condition charging and discharging can be carried out freely.

Note: When a battery is connected to the IC for the first time, discharging may not be enabled. In this case, short the  $V_M$  pin and  $V_{SS}$  pin or connect the charger to restore the normal condition.

### 2. Overcurrent Condition

When a battery in the normal status is in the status where the voltage of the  $V_M$  pin is equal to or higher than the overcurrent detection voltage because the discharge current is higher than the specified value and the status lasts for the overcurrent detection delay time, the discharge control FET is turned off and discharging is stopped. This status is called the overcurrent status. In the overcurrent status, the  $V_M$  and  $V_{SS}$  pins are shorted by the resistor between  $V_M$  and  $V_{SS}$  ( $R_{VMS}$ ) in the IC. However, the voltage of the  $V_M$  pin is at the  $V_{DD}$  potential due to the load as long as the load is connected. When the load is disconnected, the  $V_M$  pin returns to the  $V_{SS}$  potential. This IC detects the status when the impedance between the EB+ pin and EB- pin (Refer to the typical application circuit) increases and is equal to the impedance that enables automatic restoration and the voltage at the  $V_M$  pin returns to overcurrent detection voltage 1 ( $V_{IOV1}$ ) or lower and the overcurrent status is restored to the normal status.

Note: The impedance that enables automatic restoration varies depending on the battery voltage and the set value of overcurrent 1 detection voltage.

### 3. Overcharge Condition

When the battery voltage becomes higher than the overcharge detection voltage ( $V_{CU}$ ) during charging under the normal condition and the detection continues for the overcharge detection delay time ( $t_{CU}$ ), the **UTC UB261** series turns the charging control FET off to stop charging. This condition is called the overcharge condition. The overcharge condition is released by the following two cases:

(1) When the battery voltage falls below the overcharge release voltage ( $V_{CL}$ ), the **UTC UB261** series turns the charging control FET on and turns to the normal condition.

(2) When a load is connected and discharging starts, the **UTC UB261** series turns the charging control FET on and returns to the normal condition. Just after the load is connected and discharging starts, the discharging current flows through the parasitic diode in the charging control FET. At this moment the  $V_M$  pin potential becomes  $V_f$ , the voltage for the parasitic diode, higher than  $V_{SS}$  level. When the battery voltage goes under the overcharge detection voltage ( $V_{CU}$ ) and provided that the  $V_M$  pin voltage is higher than the overcurrent 1 detection voltage, the **UTC UB261** series releases the overcharge condition.

Note 1: If the battery is charged to a voltage higher than the overcharge detection voltage ( $V_{CU}$ ) and the battery voltage does not fall below the overcharge detection voltage ( $V_{CU}$ ) even when a heavy load is connected, the detection of overcurrent 1, overcurrent 2 and load shortcircuiting do not function until the battery voltage falls below over charge detection voltage ( $V_{CU}$ ). Since an actual battery has an internal impedance of several dozens of m $\Omega$ , the battery voltage drops immediately after a heavy load that causes overcurrent is connected, and the detection of overcurrent 1, overcurrent 2 and load short-circuiting function.

Note 2: When a charger is connected after the overcharge detection, the overcharge condition is not released even if the battery voltage is below the overcharge release voltage ( $V_{CL}$ ). The overcharge condition is released when the  $V_M$  pin voltage goes over the charger detection voltage ( $V_{CHA}$ ) by removing the charger.

## ■ OPERATION(Cont.)

### 4. Overdischarge Condition

When the battery voltage falls below the overdischarge detection voltage ( $V_{DL}$ ) during discharging under the normal condition and the detection continues for the overdischarge detection delay time ( $t_{DL}$ ), the **UTC UB261** series turns the discharging control FET off to stop discharging. This condition is called the overdischarge condition. When the discharging control FET is turned off, the  $V_M$  pin voltage is pulled up by the resistor between  $V_M$  and  $V_{DD}$  in the IC ( $R_{VMD}$ ). When the voltage difference between the  $V_M$  and  $V_{DD}$  then is 1.2V (typ.) or lower, the current consumption is reduced to the power-down current consumption ( $I_{PDN}$ ). This condition is called the power-down condition.

The power-down condition is released when a charger is connected and the voltage difference between the  $V_M$  and  $V_{DD}$  becomes 1.2V (typ.) or higher. Moreover when the battery voltage becomes the overdischarge detection voltage ( $V_{DL}$ ) or higher, the **UTC UB261** series turns the discharging FET on and returns to the normal condition.

### 5. Charger Detection

When a battery in the overdischarge condition is connected to a charger and provided that the  $V_M$  pin voltage is lower than the charger detection voltage ( $V_{CHA}$ ), the **UTC UB261** series releases the overdischarge condition and turns the discharging control FET on when the battery voltage becomes equal to or higher than the overdischarge detection voltage ( $V_{DL}$ ) since the charger detection function works. This action is called charger detection.

When a battery in the overdischarge condition is connected to a charger and provided that the  $V_M$  pin voltage is not lower than the charger detection voltage ( $V_{CHA}$ ), the **UTC UB261** series releases the overdischarge condition when the battery voltage reaches the overdischarge detection voltage ( $V_{DU}$ ) or higher.

### 6. Abnormal Charge Current Detection

If the  $V_M$  pin voltage falls below the charger detection voltage ( $V_{CHA}$ ) during charging under normal condition and it continues for the overcharge detection delay time ( $t_{CU}$ ), the charging control FET turns off and charging stops. This action is called the abnormal charge current detection.

Abnormal charge current detection works when the DO pin voltage is "H" and the  $V_M$  pin voltage falls below the charger detection voltage ( $V_{CHA}$ ). Consequently, if an abnormal charge current flows to an over-discharged battery, the **UTC UB261** series turns the charging control FET off and stops charging after the battery voltage becomes higher than the overdischarge detection voltage which make the DO pin voltage "H", and still after the overcharge detection delay time ( $t_{CU}$ ) elapses.

Abnormal charge current detection is released when the voltage difference between  $V_M$  pin and  $V_{SS}$  pin becomes less than charger detection voltage ( $V_{CHA}$ ).

### 7. Delay Circuits

The detection delay times are determined by dividing a clock of the approximately 3.5kHz with the counter.

Note 1: The detection delay time for overcurrent 2 ( $t_{IOV2}$ ) and load short-circuiting ( $t_{SHORT}$ ) start when the overcurrent 1 ( $V_{IOV1}$ ) is detected. When the overcurrent 2 ( $V_{IOV2}$ ) or load short-circuiting ( $V_{SHORT}$ ) is detected over the detection delay time for each of them ( $= t_{IOV2}$  or  $t_{SHORT}$ ) after the detection of overcurrent 1 ( $V_{IOV1}$ ), the **UTC UB261** series turns the FET off within  $t_{IOV2}$  or  $t_{SHORT}$  of each detection.

Note 2: When the overcurrent is detected and continues for longer than the overdischarge detection delay time ( $t_{DL}$ ) without releasing the load, the condition changes to the power-down condition when the battery voltage falls below the overdischarge detection voltage ( $V_{DL}$ ). When the battery voltage falls below the overdischarge detection voltage ( $V_{DL}$ ) due to the overcurrent, the **UTC UB261** series turns the discharging control FET off by the overcurrent detection. In this case the recovery of the battery voltage is so slow that if the battery voltage after the overdischarge detection delay time ( $t_{DL}$ ) is still lower than the over discharge detection voltage ( $V_{DL}$ ), the **UTC UB261** series shifts to the power-down condition.

### 8. 0V Battery Charge Inhibiting Function

This function inhibits the recharging when a battery that is short-circuited (0V battery) internally is connected. When the battery voltage is the 0V battery charge inhibition battery voltage ( $V_{0INH}$ ) or lower, the charging control FET gate is fixed to EB- pin voltage to inhibit charging. When the battery voltage is the 0V battery charge inhibition battery voltage ( $V_{0INH}$ ) or higher, charging can be performed.

■ TIMING CHART

■ TIMING CHART (Cont.)

(2) Discharge Overcurrent Detection

■ TIMING CHART (Cont.)

(3) Abnormal Charge Overcurrent Detection

■ TYPICAL APPLICATION CIRCUIT

- Notes:
1. Overdischarge detection voltage must be higher than the threshold voltage of M1 and M2, if not, the M1 may not cut the charging current. If the threshold voltage of M1 equal to or higher than the overdischarge detection voltage is used, discharging may be stopped before overdischarge is detected.
  2. Charger voltage must be higher than the withstanding voltage between the gate and source of M1 and M2, if not, M1 and M2 may be destroyed.
  3. Resistance of R1 can't be high, the value is about from 100Ω to 470Ω, If R1 has a high resistance, the voltage between V<sub>DD</sub> pin and V<sub>SS</sub> pin may exceed the absolute maximum rating when a charger is connected in reverse since the current flows from the charger to the IC. Insert a resistor of 100Ω or higher as R1 for ESD protection.
  4. The capacitance of C1 must not be less than 0.022μF, if not, DO pin may oscillate when load short-circuiting is detected. Be sure to connect a capacitor of 0.022μF or higher to C1, the typical value is about 0.1μF.
  5. The resistance of R2 can not be higher than 2kΩ, if not, the charging current may not be cut when a high-voltage charger is connected.
